- Note on section 2:

(1) SU : Listed values are $TAI-TA(SU) - 2.80$ seconds.

3 - Difference between the normalized frequencies of EAL (free atomic time scale) and TAI.

| | Interval of validity | $f(EAL)-f(TAI)$ | |
|-------------------------|----------------------|-------------------------|-----------------------------|
| Steering correction | 53704 - 53734 | 6.856×10^{-13} | (2005 NOV 30 - 2005 DEC 30) |
| New correction | 53734 - 53764 | 6.850×10^{-13} | (2005 DEC 30 - 2006 JAN 29) |
| New correction foreseen | 53764 - 53794 | 6.844×10^{-13} | (2006 JAN 29 - 2006 FEB 28) |

4 - Duration of the TAI scale interval.

TAI is a realization of coordinate time TT. The following tables give the fractional deviation d of the scale interval of TAI from that of TT (the SI second on the geoid), i.e. the fractional frequency deviation of TAI with the opposite sign: $d = -y_{TAI}$. In this section, a frequency over a time interval is defined as the ratio of the end-point phase difference to the duration of the interval. Whenever needed, the instability of EAL should be expressed as the quadratic sum of three components with τ in days: (1) a white frequency noise of $3.0 \times 10^{-15} / \sqrt{\tau}$, (2) a flicker frequency noise of 0.5×10^{-15} and (3) a random walk frequency noise of $1.0 \times 10^{-16} \times \sqrt{\tau}$. The relation between EAL and TAI is given in *Circular T* and the *Annual Report of the BIPM Time Section*.

In the first table, d is obtained, on the given periods of estimation by comparison of the TAI frequency with that of the given individual Primary Frequency Standards (PFS). In this table: u_A is the uncertainty originating in the instability of the PFS, u_B is the combined uncertainty from systematic effects, $Ref(u_B)$ is a reference giving information on the stated value of u_B or is the *Circular T* where this reference was first given, $u_{1/Lab}$ is the uncertainty in the link between the PFS and the clock participating to TAI, including the uncertainty due to the dead-time, $u_{1/TAI}$ is the uncertainty in the link to TAI, u is the quadratic sum of all four uncertainty values. All values are expressed in 10^{-15} .

| Standard | Period of Estimation | d | u_A | u_B | Ref(u_B) | $u_{1/Lab}$ | $u_{1/TAI}$ | u | Note |
|-----------|----------------------|------|-------|-------|--------------|-------------|-------------|------|------|
| SYRTE-JPO | 53679 53704 | 11.4 | 0.9 | 6.3 | T160 | 0.3 | 1.2 | 6.5 | (1) |
| SYRTE-JPO | 53709 53724 | 12.3 | 1.2 | 6.3 | T160 | 0.3 | 2.0 | 6.7 | (1) |
| PTB-CS1 | 53704 53734 | -1.6 | 5.0 | 8.0 | T148 | 0.0 | 1.0 | 9.5 | (2) |
| PTB-CS2 | 53704 53734 | 4.6 | 3.0 | 12.0 | T148 | 0.0 | 1.0 | 12.4 | (2) |

Notes:

- (1) Report 6 Jan. 2006 by LNE-SYRTE.
- (2) Continuously operating as a clock participating to TAI.

The second table gives the BIPM estimate of d , based on all available PFS measurements over the period MJD 53344-53734, taking into account their individual uncertainties and characterizing the instability of EAL as noted above. u is the computed standard uncertainty of d

| Period of estimation | d | u |
|----------------------|-----------------------|---|
| 53704-53734 | 4.1×10^{-15} | 1.7×10^{-15} (2005 NOV 30 - 2005 DEC 30) |

5 - Relations of UTC and TAI with GPS time and GLONASS time.

$$\begin{aligned} [UTC-GPS\ time] &= -13\ s + C_0, & [TAI-GPS\ time] &= 19\ s + C_0, & \text{global uncertainty is of order } 10\ \text{ns.} \\ [UTC-GLONASS\ time] &= 0\ s + C_1, & [TAI-GLONASS\ time] &= 32\ s + C_1, & \text{global uncertainty is of order hundreds ns.} \end{aligned}$$

The C_0 values are obtained using the values $[UTC-UTC(OP)]$ and the GPS data taken at the Paris Observatory, corrected for IGS precise orbits, clocks and ionosphere maps. The C_1 values are obtained using the values $[UTC-UTC(AOS)]$ and the GLONASS data taken at the Astrogeodynamical Observatory Borowiec (AOS). N_0 and N_1 are the numbers of measurements, when N_0 or N_1 is 0, the corresponding values of C_0 or C_1 are interpolated. The standard deviations σ_0 and σ_1 characterize the dispersion of individual measurements. The actual uncertainty of user's access to GPS and GLONASS times may differ from these values. For this circular, $\sigma_0 = 2.1\ \text{ns}$, $\sigma_1 = 15.8\ \text{ns}$

6 - Time links used for the computation of TAI and their uncertainties.

The time links used in the elaboration of this *Circular T* are listed in this section. The technique for the link is indicated as follows: GPS SC for GPS common-view single-channel C/A data; GPS MC for GPS common-view multi-channel C/A data; GPS P3 for GPS common-view multi-channel dual-frequency P code data; GPS GT for 'GPS time' observations; INT LK for internal cable link and TWSTFT for two-way satellite time and frequency transfer data.

For each link, the following uncertainties are provided: u_A is the statistical uncertainty evaluated by taking into account the level of phase noise in the raw data, the interpolation interval between data points and the effects with typical duration between 5 and 30 days. u_B is the uncertainty on the calibration, estimated by the BIPM.

The calibration type of the link is indicated as: GPS EC for GPS equipment calibration; TW EC for two-way equipment calibration; LC (technique) for a link calibrated using 'technique'; BC (technique) for a link calibrated using 'technique' to transfer a past equipment calibration through a discontinuity of link operation.

The calibration dates indicate: the most recent calibration results for the two laboratories in the case of EC and the most recent calibration of the link in the case of LC and BC, NA stands for not available, in this case estimated values are provided

| Link | Type | u_A /ns | u_B /ns | Calibration Type | Calibration Dates |
