- Note on section 2:

(1) SU : Listed values are  $TAI-TA(SU) - 2.80$  seconds.

3 - Difference between the normalized frequencies of EAL (free atomic time scale) and TAI.

	Interval of validity	$f(EAL)-f(TAI)$	
Steering correction	56654 - 56684	$6.483 \times 10^{-13}$	(2013 DEC 28 - 2014 JAN 27)
New correction	56684 - 56714	$6.483 \times 10^{-13}$	(2014 JAN 27 - 2014 FEB 26)
New correction foreseen	56714 - 56744	$6.483 \times 10^{-13}$	(2014 FEB 26 - 2014 MAR 28)

4 - Duration of the TAI scale interval.

TAI is a realization of coordinate time TT. The following tables give the fractional deviation  $d$  of the scale interval of TAI from that of TT (the SI second on the geoid), i.e. the fractional frequency deviation of TAI with the opposite sign:  $d = -y_{TAI}$ . In this section, a frequency over a time interval is defined as the ratio of the end-point phase difference to the duration of the interval. Whenever needed, the instability of EAL should be expressed as the quadratic sum of three components with  $\tau$  in days: (1) a white frequency noise of  $2.0 \times 10^{-15} / \sqrt{\tau}$ , (2) a flicker frequency noise of  $0.4 \times 10^{-15}$  and (3) a random walk frequency noise of  $0.3 \times 10^{-16} \times \sqrt{\tau}$ . The relation between EAL and TAI is given in *Circular T* and the *BIPM Annual Report on Time Activities*.

In the first table,  $d$  is obtained, on the given periods of estimation by comparison of the TAI frequency with that of the given individual Primary and Secondary Frequency Standards (PFS/SFS). In this table:  $u_A$  is the uncertainty originating in the instability of the standard,  $u_B$  is the combined uncertainty from systematic effects,  $u_{1/1ab}$  is the uncertainty in the link between the standard and the clock participating to TAI, including the uncertainty due to the dead-time,  $u_{1/TAI}$  is the uncertainty in the link to TAI,  $u$  is the quadratic sum of all four uncertainty values. Ref( $u_B$ ) is a reference giving information on the values of  $u_B$  or is the *Circular T* where the reference was first given.  $u_B(\text{Ref})$  is the  $u_B$  value stated in this references. Note that all uncertainties may vary over time and that the current  $u_B$  values are generally not the same as the peer reviewed values given in Ref( $u_B$ ). See "<http://www.bipm.org/jsp/en/TimeFtp.jsp>" for previous issues of *Circular T* and individual Reports of Evaluation of Primary and Secondary Frequency Standards that explain changes in uncertainties. For the SFS,  $u_{Srep}$  represents the recommended uncertainty of the secondary representation of the second and Ref( $u_S$ ) provides the reference for the frequency of the transition and its uncertainty  $u_{Srep}$ , these two fields are not applicable to PFS. All values are expressed in  $10^{-15}$  and are valid only for the stated period of estimation.

Standard	Period of Estimation	$d$	$u_A$	$u_B$	$u_{1/Lab}$	$u_{1/TAI}$	$u$	$u_{Srep}$	Ref( $u_S$ )	Ref( $u_B$ )	$u_B(\text{Ref})$	Note
PTB-CS1	56654 56684	-7.69	6.00	8.00	0.00	0.07	10.00	PFS/NA		T148	8.	(1)

Notes:

- (1) Continuously operating as a clock participating to TAI
- (2) Report 03 FEB. 2014 by NPL
- (3) Report 30 JAN. 2014 by PTB

The second table gives the BIPM estimate of  $d$ , based on all available PFS and SFS measurements over the period MJD 56294-56684, taking into account their individual uncertainties and characterizing the instability of EAL as noted above.  $u$  is the computed standard uncertainty of  $d$

Period of estimation	$d$	$u$
56654-56684	$0.46 \times 10^{-15}$	$0.28 \times 10^{-15}$ (2013 DEC 28 - 2014 JAN 27)

5 - Relations of UTC and TAI with predictions of UTC(k) disseminated by GNSS and their System Times.

$$\begin{aligned}
 [UTC-GPS \text{ time}] &= -16 \text{ s} + C_0, & [TAI-GPS \text{ time}] &= 19 \text{ s} + C_0, & \text{global uncertainty is of the order of 10 ns.} \\
 [UTC-UTC(USNO)_{GPS}] &= C_0', & [TAI-UTC(USNO)_{GPS}] &= 35 \text{ s} + C_0', & \text{global uncertainty is of the order of 10 ns.} \\
 [UTC-GLONASS \text{ time}] &= C_1, & [TAI-GLONASS \text{ time}] &= 35 \text{ s} + C_1, & \text{global uncertainty is of the order of hundreds ns.} \\
 [UTC-UTC(SU)_{GLONASS}] &= C_1', & [TAI-UTC(SU)_{GLONASS}] &= 35 \text{ s} + C_1', & \text{global uncertainty is of the order of hundreds ns.}
 \end{aligned}$$

[UTC(USNO)<sub>GPS</sub>] and [UTC(SU)<sub>GLONASS</sub>] are, respectively, UTC(USNO) and UTC(SU) as predicted by USNO and SU and disseminated by GPS and GLONASS. The  $C_0$  and  $C_0'$  values provide realizations of GPS time and of the prediction of UTC(USNO) broadcast by GPS, as obtained using the values [UTC-UTC(OP)] and the GPS data taken at the Paris Observatory, corrected for IGS precise orbits, clocks and ionosphere maps. The  $C_1$  and  $C_1'$  values provide realizations of GLONASS time and of the prediction of UTC(SU) broadcast by GLONASS, as obtained using the values [UTC-UTC(AOS)] and the GLONASS data taken at the Astrogeodynamical Observatory Borowiec (AOS).  $N_0$ ,  $N_0'$ ,  $N_1$  and  $N_1'$  are the numbers of measurements; when  $N_0$ ,  $N_0'$ ,  $N_1$  or  $N_1'$  is 0, the corresponding values in the table are interpolated. The standard deviations  $\sigma_0$ ,  $\sigma_0'$ ,  $\sigma_1$  and  $\sigma_1'$  characterize the dispersion of individual measurements. The actual uncertainty of users' access to GPS and GLONASS times may differ from these values. For this edition of circular,  $\sigma_0 = 1.1$  ns,  $\sigma_0' = 1.0$  ns,  $\sigma_1 = 6.9$  ns,  $\sigma_1' = 6.9$  ns

6 - Time links used for the computation of TAI and their uncertainties.

The time links used in the elaboration of this *Circular T* are listed in this section. The technique for the link is indicated as follows:

GPS SC for GPS all-in-view single-channel C/A data; GPS MC for GPS all-in-view multi-channel C/A data; GPS P3 for GPS all-in-view multi-channel dual-frequency P code data; GPS PPP for GPS Precise Point Positioning technique; GPS GT for 'GPS time' observations; GLN MC for GLONASS common-view multi-channel C/A data; GPSGLN for the combination of GPS MC and GLN MC links; TWGPPP/TWGPP3 for the combined smoothing of TWSTFT and GPS PPP/GPS P3; INT LK for internal cable link and TWSTFT for two-way satellite time and frequency transfer data.

For each link, the following uncertainties are provided:  $u_A$  is the standard uncertainty accounting for measurement noise and random effects with typical duration between 1 day and 30 days.  $u_B$  is the estimated uncertainty of the calibration.

The calibration type of the link is indicated as: GPS EC for GPS equipment calibration; TW EC for two-way equipment calibration; LC (technique) for a link calibrated using 'technique'; BC (technique) for a link calibrated using 'technique' to transfer a past equipment calibration through a discontinuity of link operation. DIC is used for direct internal calibration.

The calibration dates indicate: the most recent calibration results for the two laboratories in the case of EC and the most recent calibration of the link in the case of LC and BC. NA stands for not available, in this case estimated values are provided.
