Since the 1st of January 1988, the establishment of International Atomic Time, TAI, and of Coordinated Universal Time, UTC (with the exception of the determination and the announcement of leap seconds of UTC) has been the responsibility of the Bureau International des Poids et Mesures (BIPM) under the authority of the Comité International des Poids et Mesures (CIPM).

The determination and announcement of the dates of leap seconds of UTC are among the tasks of the International Earth Rotation Service (IERS), which is responsible for Earth rotation determination and maintainance of the related celestial and terrestrial reference systems.

Information on IERS can be obtained from

Depuis le 1^{er} janvier 1988, l'établissement du Temps atomique international, TAI, et du Temps universel coordonné, UTC, (à l'exception de l'annonce des secondes intercalaires de l'UTC) est placé sous la responsabilité du Bureau international des poids et mesures (BIPM) et du Comité international des poids et mesures (CIPM).

Le choix des dates et l'annonce des secondes intercalaires de l'UTC constituent quelques-unes des missions du Service international de la rotation terrestre (IERS), qui est responsable de la détermination de la rotation terrestre et de la conservation des systèmes de référence terrestre et céleste associés.

1 - ESTABLISHMENT OF INTERNATIONAL ATOMIC TIME AND COORDINATED UNIVERSAL TIME IN 1990

International Atomic Time (TAI) and Coordinated Universal Time (UTC) are obtained from a combination of the readings of atomic clocks and frequency standards spread worldwide.

An iterative algorithm produces a free atomic time scale, EAL (Echelle atomique libre) defined as a weighted average of clock readings. The processing is done in deferred-time and treats two-month blocks of data [1] [2]. The weighting procedure and clock frequency prediction are chosen so that EAL is optimized for long-term stability. No attempt is made to ensure the conformity of the EAL unitary scale interval with the second of the International System of Units: this interval may diverge progressively from the second.

The duration of the unitary scale interval of EAL is evaluated by comparison with the data of primary cesium standards. TAI is then derived from EAL by adding a linear function of time with a convenient slope to ensure the accuracy of the TAI unitary scale interval. The frequency offset between TAI and EAL is changed when necessary to maintain accuracy, the magnitude of the changes being of the same order as the frequency fluctuations resulting from the instability of EAL. This operation is referred to as "steering" of TAI.

TAI and UTC are made available in the form of time differences with respect to time scales kept by national laboratories "k": UTC(k), approximation to UTC, and TA(k), independent local atomic time.

These differences UTC - UTC(k), TAI - TA(k), are computed at 10-day intervals for Modified Julian Dates (MJD) ending in 9, at 0h UTC, and designated here as "standard dates".

The computation of TAI has a basic periodicity of two months. However a provisional computation is made every other month (January, March, etc.) with the data which is available. The following month, TAI is recomputed for the whole span of two months. The deviations between the provisional one-month and complete two-month solutions are usually smaller than 10 ns. This organization allows the monthly publication of results in the BIPM Circular T.

When preparing the Annual Report, the results of Circular T are revised taking into account some improvement in the data made known after the publication of Circular T. The computation is then strictly made for the six two-month intervals of the year.

the following, and everywhere in this Report, the laboratories are cited by the acronyms explained in Table 1 of Part B.

2 - TIME LINKS USED BY THE BIPM IN 1990

The network of time links used by the BIPM in 1990 is non-redundant.

2.1 LORAN-C links

The laboratories where only LORAN-C is received are preferably linked to laboratories where both LORAN-C and GPS are received. Simultaneous receptions of the LORAN-C signals have been organized.

The time differences of the UTC(k)'s of the laboratories are computed daily, then the values at the standard dates are evaluated by linear fit over 10 days (5 before and 5 after the standard date), except when time or frequency steps of the UTC(k)'s are reported or found.

The following LORAN-C time comparisons are evaluated by the BIPM and used in TAI computation (end 1990):

2.2 GPS links

Time comparisons can be made by simultaneous tracking of satellites ("common-view method") according to a schedule established and proposed to contributing laboratories by the BIPM.

However, in the BIPM evaluation of time comparisons, a "clock transportation mode" is generally applied. In this mode UTC(j) - GPS time and UTC(k) - GPS time are evaluated separately from the data of satellites which can be observed from these sites at their maximum of elevation, without requiring the simultaneity of the observations. By filtering and interpolating, daily values of these quantities are obtained at 0h UTC. Then UTC(j) - UTC(k) is obtained by differences at the standard dates. The reasons for using this method are that it may give better results than the common-view approach over very long distances, and that it allows a local treatment inside the participating laboratories and thus reduces the amount of data to be transmitted (cases of DPT and ONRJ).

In TAI computation, the following GPS links are used (end 1990):

Measurements of ionospheric delays obtained from dual-frequency GPS receivers are now available. Current measurements performed at the CRL and the BIPM with realtime TECmeters, developed by the CRL in early 1989, allow the correction of time comparison TAO - OP for the whole year 1990. Some other ionospheric measurements, obtained at OP and NIST from prototypes of the Ionospheric Measurement System, developed in 1990 by the NIST, are used for experimental purposes, but are not yet introduced on a regular basis into the TAI computation.

The quality of GPS time links is greatly improved by the use of accurate antenna coordinates. On 1990 June 12 at 0h00 UTC, the BIPM proposed the introduction of new coordinates (see Table A) into the GPS time receivers. There were obtained by a combination of two techniques: geodetic methods which give the relative position of the antenna with respect to the nearest IERS site, and the BIPM method of differential positioning [3] between GPS antennas. This action has ensured the worldwide homogeneity in the IERS Terrestrial Reference Frame (ITRF) of the coordinates of all national laboratories equipped with GPS receivers.

Precise ephemerides of GPS satellites, computed by the US Defense Mapping Agency, have been received at the BIPM since early 1990. They are used experimentally to correct time comparisons for the satellites position. In 1990, the delay of access (2 months) to precise ephemerides was too long to introduce this correction in current TAI computation.

2.3 GLONASS links

From his current observations of both the GPS and GLONASS satellite systems Prof. P. Daly, University of Leeds, establishes and reports GPS time - GLONASS time, as well as UTC(USNO) - UTC(SU) at ten-day intervals.

In TAI computation, the only available GLONASS link is (end 1990):

USNO - SU (from 1990 June 27).

2.4 Television links

The simultaneous reception of public television signals provides the links

2.5 Two-way time transfer via geostationary satellites

For experimental purposes, two-way time transfers via geostationary satellites have been carried out since early 1990, on the one hand between NIST, NRC and USNO in North America, and on the other hand between TUG and OCA in Europe. These experimental results were not used for TAI computation in 1990.

3. ACCURACY OF THE TAI SCALE INTERVAL

Table B gives the normalized frequency offsets between EAL and TAI. The relationship TAI-EAL was modified five times in 1990, by frequency offsets of 0.5×10^{-14} in order to compensate a frequency drift of EAL with respect to the primary standards of the PTB.

As the time scales UTC and TAI differ by an integral number of seconds (see Tables 2 and 3 of Part B), UTC is necessarily subject to the same intentional frequency adjustment as TAI.

4. TIME SCALES ESTABLISHED IN RETROSPECT

For the most demanding applications, such as millisecond pulsar timing, the BIPM issues atomic time scales in retrospect designated as TT(BIPMxx) where 1900 + xx is the year of computation [4]. The successive versions of TT(BIPMxx) are both updates, and revisions: they may differ for common dates. These time scales are available on request from the BIPM.

1. ETABLISSEMENT DU TEMPS ATOMIQUE INTERNATIONAL ET DU TEMPS UNIVERSEL COORDONNÉ EN 1990

Le Temps atomique international (TAI) et le Temps universel coordonné (UTC) sont obtenus par une combinaison des lectures de données d'horloges atomiques et d'étalons primaires de fréquence répartis dans le monde entier.

Un algorithme itératif qui traite en temps différé des blocs de 2 mois de données [1] [2], produit une "échelle atomique libre", EAL, définie comme étant une moyenne pondérée de lectures d'horloges. Le choix de la pondération et du mode de prédiction de fréquence optimise la stabilité de l'EAL à long terme. Il n'est pas tenté d'assurer la conformité de l'intervalle unitaire de l'EAL avec la seconde du Système international d'unités, elle peut en diverger lentement, mais indéfiniment.

La durée de l'intervalle unitaire de l'EAL est évaluée par comparaison aux données d'étalons de fréquence à césium primaires. Ensuite le TAI se déduit de l'EAL par l'addition d'une fonction linéaire du temps dont la pente est convenablement choisie pour assurer l'exactitude de l'intervalle unitaire du TAI. Le décalage de fréquence entre le TAI et l'EAL est changé quand c'est nécessaire pour maintenir l'exactitude, les changements ayant le même ordre de grandeur que les fluctuations de fréquence qui résultent de l'instabilité de l'EAL. Cette opération est désignée par l'expression "pilotage du TAI".

Le TAI et l'UTC sont disponibles sous forme de différences de temps avec les échelles de temps conservées par des laboratoires horaires nationaux "k" : UTC(k), approximation de UTC, et TA(k), temps atomique local indépendant.

Les différences UTC - UTC(k), TAI - TA(k), sont calculées de 10 jours en 10 jours pour les dates juliannes modifiées (MJD) se terminant par 9, à 0h UTC, "dates normales".

Le calcul du TAI doit être fait, en principe, tous les deux mois. Mais un calcul provisoire est fait un mois sur deux (pour janvier, mars, ...) avec les données disponibles. Le mois suivant, le calcul du TAI est repris pour une durée de deux mois. L'écart entre les résultats des calculs provisoire et complet est ordinairement inférieur à 10 ns. Cette organisation permet la publication mensuelle des résultats dans la Circulaire T du BIPM.

Quand le Rapport annuel est préparé, les résultats de la circulaire T sont révisés, compte-tenu des améliorations de données, connues après la publication de la Circulaire T. Les calculs sont alors strictement faits par période de deux mois.

Dans la suite et dans tout ce rapport, les laboratoires sont désignés par les sigles explicités dans la table 1 de la partie B.

2. LIAISONS HORAIRES UTILISEES PAR LE BIPM EN 1990

Le système non-redondant des liaisons entre les UTC(k) des laboratoires participants est établi pour les dates normales

- par le LORAN-C,
- par le GPS,
- par le GLONASS,
- par la réception d'impulsions de la télévision publique.

Dans toutes ces méthodes on fait appel généralement à la réception simultanée des signaux et l'on recherche la meilleure estimation des différences des UTC(k) aux dates normales.

L'ensemble des liaisons utilisées est donné dans le texte anglais qui précède.

On dispose maintenant de mesures du retard ionosphérique obtenues à partir de récepteurs GPS double-fréquence. Des mesures régulières au CRL et au BIPM, réalisées avec l'équipement développé par le CRL, ont été utilisées pour corriger la liaison TAO-OP en 1990. Les systèmes de mesures ionosphériques, développés par le NIST, et en fonctionnement à l'OP et au NIST, ne sont utilisés qu'à but expérimental. Les mesures qu'ils délivrent ne sont pas encore introduites dans les calculs courants du TAI.

La qualité des comparaisons horaires par GPS est largement améliorée si les coordonnées d'antenne sont connues avec précision. Le BIPM a suggéré de corriger les coordonnées d'antennes introduites dans les récepteurs GPS (voir le tableau A) le 12 juin 1990, à 0h00 UTC. Ces coordonnées plus exactes avaient été obtenues grâce à deux techniques : des méthodes géodésiques qui donnent la position de l'antenne par rapport au site IERS le plus proche, et la méthode de positionnement différentiel développée par le BIPM [3]. L'homogénéisation mondiale des coordonnées d'antennes de tous les laboratoires nationaux équipés de récepteurs GPS a donc été réalisée dans le système de référence terrestre de l'IERS.

Le BIPM reçoit les éphémérides précises des satellites GPS, produites par la DMA, depuis le début de 1990. Elles permettent d'améliorer les comparaisons horaires par correction de la position du satellite. A cause du délai d'accès (2 mois), ce travail reste à un niveau expérimental et les données d'éphémérides précises ne sont pas introduites dans les calculs courants du TAI.

Des comparaisons de temps par la méthode des deux voies utilisant un satellite géostationnaire ont été réalisées à titre expérimental, d'une part entre le NIST, le NRC et l'USNO en Amérique du Nord, d'autre part entre le TUG et l'OCA en Europe. Les résultats de ces expériences n'ont pas été utilisés pour le calcul du TAI en 1990.

3. EXACTITUDE DE L'INTERVALLE UNITAIRE DU TAI

Le tableau B (texte anglais) donne le décalage de fréquence entre le TAI et l'EAL. La relation entre le TAI et l'EAL a été modifiée cinq fois en 1990, par des décalages de fréquence de $0,5 \times 10^{-14}$, afin de compenser une dérive de fréquence de l'EAL par rapport aux étalons primaires de la PTB.

4. ECHELLES DE TEMPS ETABLIES RETROSPECTIVEMENT

Pour les applications les plus exigeantes, comme le chronométrage des pulsars milliseconde, le BIPM produit des échelles de temps rétrospectivement, désignées par TT(BIPMxx), 1900 + xx étant l'année du calcul [4]. Les versions successives de TT(BIPMxx) ne sont pas seulement des mises à jour, mais aussi des révisions, de sorte qu'elles peuvent différer pour les dates communes. Ces échelles de temps sont disponibles sur demande faite au BIPM.

Les références sont données dans le texte anglais.

(2) As a consequence of the unification of Germany the ASMW became a part of the PTB on 1990 October 3rd. The clocks kept by the former ASMW are now compared to UTC(PTB).

(3) Industrial Cs clocks and H-Masers kept by different laboratories in Australia.

(4) The standards are located as follows (at the end of 1990) :

| | | |
|---------------------------------------|-------|-------|
| Office Fédéral de Métrologie (Bern) | (OFM) | 7 Cs |
| Observatoire de Neuchâtel (Neuchâtel) | (ON) | 4 Cs |
| Direction Générale des PTT (Bern) | (PTT) | 2 Cs. |

They are intercompared by LORAN-C (OFM-ON) and TV method (OFM-PTT) and linked to the foreign laboratories through the Swiss Federal Office of Metrology.

(5) As a consequence of the unification of Germany the ASMW became a part of the PTB on 1990 October 3rd. The computation of TA(DDR) was simultaneously stopped.

(6) The standards are located as follows : ASMW, 2 Cs ; ZIPE, 1 Cs.

NOTES (CONT.)

(7) The standards are located as follows (at the end of 1990) :

| | |
|---|------|
| Centre Electronique de l'Armement (Rennes) | 2 Cs |
| Centre National d'Etudes Spatiales (CNES) | 2 Cs |

| Cable links : OB-LPMO, OB-ENSMM. | |
| Other national links by the TV method. | |
| Link to foreign laboratories through OP(LPTF) by GPS. | |

(8) The standards are located as follows :

| |
|---|
| Shaanxi Astronomical Observatory (CSAO) |
| Shanghai Astronomical Observatory (SO) |
| Beijing Astronomical Observatory |
| Wuhan Time Observatory |
| Beijing Institute of Radio Metrology and Measurement. |

(9) Reception of GPS and GLONASS signals on a common receiver.

(10) The laboratory primary standard controls TA(NIST) via an accuracy algorithm. Six of the commercial standards provide the reference for WWV and WWVB and two for GOES satellite time but do not contribute directly to TA(NIST); they are available for NIST time scales back-up and are compared to TA(NIST) to within 0.01 µs. An other independent local time is evaluated by a different algorithm. It is designated as AT1, and appears in the BIPM publications as TA(NISA).

(11) For experimental purposes, two-way satellite time transfer operates between NIST and NRC, and between NIST and USNO.

(12) NRC Cs VIA was the source of UTC(NRC) until 1990 June 2, 19hUTC. UTC(NRC) was then provided by NRC Cs V. The relations between UTC(NRC) and these primary clocks, with PT designating proper time, are in microseconds :
from 1990 January 1, 0hUTC to 1990 January 28, 19hUTC.

$$\text{UTC(NRC)} = \text{PT(NRC Cs VIA)} - 0.017387 \times (\text{MJD}-47892) + 16.541,$$

from 1990 February 7, 0hUTC to 1990 May 18, 0hUTC,

$$\text{UTC(NRC)} = \text{PT(NRC Cs VIA)} - 0.017387 \times (\text{MJD}-47892) + 16.742,$$

from 1990 June 7, 0hUTC to 1991 January 1, 0hUTC,

$$\text{UTC(NRC)} = \text{PT(NRC Cs V)} - 0.00097 \times (\text{MJD}-48043) + 26.854.$$

NOTES (CONT.)

- (13) Reception of Soviet Union LORAN chain 8000.
- (14) The two Lab. Cs are functionning continuously (primary clocks). TA(PTB) and UTC(PTB) are derived directly from a local oscillator monitored by the primary clock CS1.
MEZ(D) = UTC(PTB) + 1 h or MESZ(D) = UTC(PTB) + 2 h (summer time) is the legal time of the Federal Republic of Germany, which is disseminated by DCF77.
Two Ind. Cs are located at the transmitter station Mainflingen and provide the DCF77 steering signal.
- (15) For experimental purposes two-way satellite time transfer operates between TUG and OCA (Observatoire de la côte d'Azur, Grasse, France)
- (16) The time scales UTC(USNO) and A.1(MEAN), both computed by USNO, depend on nominally 20 Cs clocks, selected on the basis of observed 5-day stability.
- (17) The time scale A.1(MEAN) computed by USNO is designated as TA(USNO) in the BIPM publications.
- (18) The daily time differences (published weekly, Series 4 of USNO) gives the values of UTC(USNO MC) - transmitting station for :
 - the LORAN-C chains,
 - the Washington D.C. TV Station WTTG,
 - the GPS satellite system.These data are also available via the Automated Data Service (ADS) and the General Electric Mark 3 international computer network (RC28 catalog).
The ADS may be accessed on :

TABLE 7. PRIMARY FREQUENCY STANDARDS USED AS CLOCKS

Five primary frequency standards were used as clocks in 1990: NRC CsV, NRC CsVI A and C, and PTB CS1 and CS2. The following table gives the time differences in microseconds, between TAI and these laboratory standards.

TABLE 7. (CONT.)

NOTES

- (1) The time scales under the headings PTB CS1, CS2 are coordinate time scales at sea level derived from the scales of proper time produced by standards CS1 and CS2 of PTB. The gravitational correction is $-0.00066\mu\text{s}/\text{d}$.
- (2) The time scales under the headings NRC Cs V, Cs VI A, Cs VI C, are the scales of proper time PT(NRC Cs V), PT(NRC Cs VI A), PT(NRC Cs VI C), produced directly by primary frequency standards Cs V, Cs VI A, Cs VI C, of NRC used as clocks. The gravitational frequency correction to these time scales of proper time to obtain coordinate times at sea level is $-0.00097\mu\text{s}/\text{d}$.

TABLE 8A. UTC - UTC(k)

The following table gives the values of UTC-UTC(k), where UTC(k) denotes the approximation to UTC kept by laboratory k. The values are rounded to 10 ns for laboratories linked via LORAN-C or television.

Unit is one microsecond.

- (8) KSRI. Change of master clock on MJD = 47934.1
- (9) NAOM. Time step of UTC(NAOM) of -35 μ s on MJD = 47891.99
The apparent time step of UTC(NAOM) of about 0.500 μ s between MJD = 47919 and MJD = 47929 results from a change of GPS receiver at NAOM on MJD = 47923.
Change of master clock on MJD = 48195.

(16) TUG . Time steps of UTC(TUG) of 9 μ s on MJD = 47903.508 and MJD = 48244.326

(17) USNO. UTC(USNO) designates the scale UTC(USNO MC) of USNO.

(18) YUZM. Time step of UTC(YUZM) of -5 μ s on MJD = 48103.5

TABLE 8B. TAI - GPS TIME AND UTC - GPS TIME

GPS satellites disseminate a common time scale designated as 'GPS time'. The relation between GPS time and TAI is :

$$\text{TAI} - \text{GPS time} = 19\text{s} + C_0,$$

where the time difference of 19 seconds is kept constant and C_0 is a quantity of the order of a few hundreds of nanoseconds, varying with time.

The relation between GPS time and UTC involves a variable number of seconds as a consequence of the leap seconds of the UTC system and is as follows:

until 1990 January 1, 0hUTC:

$$\text{UTC} - \text{GPS time} = -5\text{s} + C_0,$$

from 1990 January 1, 0hUTC, until 1991 January 1, 0hUTC :

$$\text{UTC} - \text{GPS time} = -6\text{s} + C_0,$$

from 1991 January 1, 0hUTC:

$$\text{UTC} - \text{GPS time} = -7\text{s} + C_0.$$

Here C_0 is given at 0hUTC every day.

C_0 is computed as follows: the GPS data taken at OP are first corrected for the measured ionospheric delays. Then they are smoothed to obtain daily values of $\text{UTC(OP)} - \text{GPS time}$ at 0hUTC. $\text{UTC} - \text{GPS time}$ is derived from them using linear interpolation of $\text{UTC} - \text{UTC(OP)}$ from Table 8A. The r values, also reported here, are the residuals to the smoothed data for the middle of the 13-minute tracking period. They show the quality of the synchronization.

UTC may be derived at any site from observation of any listed satellite, by interpolating C_0 to the tracking time. The quality of access to UTC mainly depends upon local conditions of observation.

Note:

The reference times reported in the following tables are given for the first date of the table only. They correspond to mid-points of 13-minute trackings.

* corresponds to data rejected in the smoothing.
- corresponds to missing data.

TABLE 8C. COMPLEMENT TO TABLE 8B

The following tables give the residuals r computed from the observation of a selection of Block II satellites, with respect to the smoothed data UTC - GPS time obtained from Block I satellites only. The C0 values reported here, from 1990 June 12 to 1991 January 1, are already given in Table 8B.

The following tables give the evidence of the turning on or off of Selective Availability on Block II satellites.

TABLE 8D. UTC - GLONASS TIME

The GLONASS satellites disseminate a common time scale designated as 'GLONASS time'. The relation between UTC and GLONASS time can be written as :

$$\text{UTC} - \text{GLONASS time} = C1 \text{ (modulo 1s).}$$

From his current observation of both the GPS and GLONASS satellite systems Prof. P. Daly, University of Leeds, establishes and reports GPS time - GLONASS time at ten-day intervals, together with the standard deviation SD of his daily GLONASS data. C1 is then derived using UTC - GPS time of Table 8B.

TABLE 10A. RATES RELATIVE TO TAI OF THE CONTRIBUTING CLOCKS

Mean clock rates relative to TAI are computed for two-month intervals ending at the dates given in the table.

When an intentional frequency adjustment has been applied to a clock, the data prior to this adjustment are corrected, so that Table 10A gives homogeneous rates for the whole year 1990. For studies including the clock rates of previous years, corrections must be brought to the data published in the Annual Reports for 1988 and 1989 and in the BIH Annual Reports for the previous years. These corrections are given in Table 10B.

Unit in ns/day, *** denotes that the clock was not used.

Notes:

- (1) As a consequence of the unification of Germany, the ASMW became a part of the PTB on 1990 October 3rd. It follows that clock ASMW 16 76, which continuously operated in 1990, is designated as PTB 16 76 for the last four months of the year.
- (2) Clock F 14 347 was designated as F 12 347 in the previous Annual Report.
- (3) Hydrogen masers SU 403801 and 403802 were designated as SU 40 381 and 40 382 in previous Annual Reports.

TABLE 10B. CORRECTIONS FOR HOMOGENEOUS USE OF THE CLOCK RATES PUBLISHED IN THE CURRENT AND PREVIOUS ANNUAL REPORTS.

Each line refers to the same clock working without interruption.

(1) A correction of +41.60 ns/d has to be applied for the last three two-month intervals of 1986.

(2) A correction of +98.60 ns/d has to be applied in 1986 and 1985.

(3) A correction of +16.93 ns/d has to be applied in 1986, 1985 and for the last three two-month intervals of 1984.

(4) A correction of -13.00 ns/d has to be applied in 1986.

(5) A correction of +46.00 ns/d has to be applied in 1986, 1985 and for the last two-month interval of 1984.

TABLE 11A. WEIGHTS OF THE CONTRIBUTING CLOCKS

Clock weights are computed for two-month intervals ending at the dates given in the table.

Since 1988 January 1st, the absolute weight of a given clock cannot exceed the value 100. For the year 1990, it corresponds to a maximum relative weight of about 1.7%.

*** denotes that the clock was not used.

The clocks are designated by their type (2 digits) and serial number in the type. The codes for the types are:

Notes:

- (1) As a consequence of the unification of Germany, the ASMW became a part of the PTB on 1990 October 3rd. It follows that clock ASMW 16 76, which continuously operated in 1990, is designated as PTB 16 76 for the last four months of the year.
- (2) Clock F 14 347 was designated as F 12 347 in the previous Annual Report.
- (3) Hydrogen masers SU 403801 and 403802 were designated as SU 40 381 and 40 382 in previous Annual Reports.

* A priori null weights (test interval of new clocks).

** Null weight resulting from the statistics.

Clocks with missing data during a two-month interval of computation are excluded.

TABLE 12. MEASUREMENTS OF THE EAL AND TAI FREQUENCIES

The following table gives the differences of frequencies, measured in 1985-1990, between EAL, and TAI, and the laboratory cesium standards: CRL Cs1, NIST 6, NRC CsV, NRC CsVI A, B, C, PTB CS1, PTB CS2, SU MCsR 101, SU MCsR 102. The frequencies are expressed at sea level (gravitational corrections applied).

The standard CRL Cs1 (previously RRL Cs1) performs discontinuous calibrations of UTC(CRL) which are transferred to EAL by linear adjustment of EAL-UTC(CRL) over 60 days.

The standard NIST 6 (previously NBS 6) is operated in discontinuous mode. The calibration data, referred to UTC(NIST), are transferred to EAL and TAI by a linear adjustment of EAL-UTC(NIST) over 80 days.

The standard NRC CsV has been working as a clock since May 1975. The EAL and TAI calibrations result from a linear adjustment of EAL-standard over 60-day intervals.

The standards NRC Cs VI A and C have been used as clocks since the end of 1979 and the calibration data are transferred to EAL as for NRC CsV. The standard NRC Cs VI B was used as clock from the end of 1979 until the beginning of 1988.

The standard PTB CS1 was used as a frequency reference operating discontinuously until July 1978. Since then, it has been running as a clock, and the calibrations are obtained as for NRC CsV. The standard PTB CS2 runs as a clock. The data, starting from August 1986, have been used in the same way as those of PTB CS1.

The standards SU MCsR 101 and 102 provide the frequency of TA(SU) and UTC(SU). The transfer to EAL is made by averaging the frequency difference of TA(SU) and EAL over several months.

TABLE 13. MEAN DURATION OF THE TAI SCALE INTERVAL IN SI SECONDS AT SEA LEVEL

The estimate of the mean duration of the TAI scale interval in SI seconds at sea level, is computed by the BIPM according to the method described in ' Azoubib J., Granveaud M., Guinot B., Metrologia 13, 1977, pp. 87-93 ' and is based on the calibrations of Table 12.

In the BIH Annual Reports from 1984 to 1987, the uncertainty was conservatively estimated to $5 \cdot 10^{-14}$ since 1979. In the above table, the uncertainty is strictly the output of the computation and is based on the uncertainties reported by the laboratories.

PARTIE C

SIGNAUX HORAIRES

The time signal emissions reported here follow the UTC system, in accordance with the Recommendation 460-4 of the International Radio Consultative Committee (CCIR), unless otherwise stated.

Their maximum departure from the Universal Time UT1 is thus 0.9 second.

The following tables are based on information received at the BIPM in February and March 1991.

| BPM | Pucheng China 35° 0'N 109° 31'E | 2 500 5 000 10 000 15 000 | 7 h 30 m to 1 h continuous continuous 1 h to 9 h | UTC time signals (The signals are emitted in advance on UTC by 20 ms). Second pulses of 10 ms of 1 kHz modulation. Minute pulses of 300 ms of 1 kHz modulation. From minutes 0 to 10, 15 to 25, 30 to 40, 45 to 55. UT1 time signals are emitted from minutes 55 to 59. |
| BSF | Chung-Li Taiwan ROC 24° 57'N 121° 9'E | 5 000 15 000 | continuous except interruption between minutes 35 and 40 | (a) From min. 5 to 10, 15 to 20, 25 to 30, 45 to 50, 55 to 60, second pulses of 5 ms duration without 1 kHz modulation. (b) From min. 0 to 5, 10 to 15, ..., 50 to 55, second pulses of 5 ms duration with 1 kHz modulation. The 1 kHz modulation is interrupted 40 ms before and after the pulses. (c) Minute pulses are extended to 300 ms. (d) DUT1: CCIR code by lengthening. |
| CHU | Ottawa Canada 45° 18'N 75° 45'W | 3 330 7 335 14 670 | continuous | Second pulses of 300 cycles of a 1 kHz modulation, with 29th and 51st to 59th pulses of each minute omitted. Minute pulses are 0.5 s long. Hour pulses are 1.0 s long, with the following 1st to 10th pulses omitted. A bilingual (Fr. Eng.) announcement of time (UTC) is made each minute following the 50th second pulse. FSK time code after 10 cycles of 1 kHz on the 31st to 39th seconds. Broadcast is single sideband; upper sideband with carrier reinsert. DUT1 : CCIR code by split pulses. |
| DCF77 | Mainflingen Germany, F.R. 50° 1'N 9° 0'E | 77.5 | continuous | At the beginning of each second (except the 59th second) the carrier amplitude is reduced to about 25 % for a duration of 0.1 s or 0.2 s. Coded transmission of year, month, day, hour, minute and day of the week in a BCD code from second marker No 21 to No 58 (The second marker durations of 0.1 s or 0.2 s correspond to a binary 0 or a binary 1 respectively). The coded time information is related to legal time of FRG and second markers 17 and 18 indicate if the transmitted time refers to UTC(PTB) + 2 h (summer time) or UTC(PTB) + 1 h. Second marker No 15 is prolonged to 0.2 s, if the reserve antenna is in use. To achieve a more accurate time transfer and better use of the frequency spectrum available, an additional pseudo random phase - shift keying of the carrier is superimposed to the AM second markers. No transmission of DUT1. |

Advance by 1 hour in summer. | Second pulses of 5 cycles of 1 kHz modulation. Minute pulses of 20 cycles. Voice announcements every 15 m beginning at 0 h 0 m. Time announcement by Morse code beginning at 0 h 5 m. DUT1 : CCIR code by double pulse. |
| IBF | Torino Italy 45° 2'N 7° 42'E | 5 000 | During 15 m preceding 7 h, 9 h, 10 h, 11 h, 12 h, 13 h, 14 h, 15h, 16 h, 17 h, 18 h. Advanced by 1 hour in summer. | Second pulses of 5 cycles of 1 kHz modulation. These pulses are repeated 7 times at the minute. Voice announcements at the beginning and end of each emission. Time announcement (C.E.T.) by Morse code every ten minutes beginning at 0 h 0 m. DUT1 : CCIR code by double pulse. |
| JG2AS | Sanwa Ibaraki Japan 36° 11'N 139° 51'E | 40 | continuous, except interruptions during communications. | A1 type second pulses of 0.5 s duration. Second 59 is of 0.2 s duration. No DUT1 code. During experimental coded transmission of the total day, hour, minute and DUT1, second pulses are 0.2 s, 0.5 s and 0.8 s duration. |
| JJY | Sanwa Ibaraki Japan 36° 11'N 139° 51'E | 2 500 5 000 8 000 10 000 15 000 | continuous, except interruption between minutes 35 and 39. | Second pulses of 8 cycles of 1 600 Hz modulation. Minute pulses are preceded by a 600 Hz modulation. DUT1 : CCIR code by lengthening. |
| LOL1 | Buenos-Aires Argentina 34° 37'S 58° 21'W | 5 000 10 000 15 000 | 11 h to 12 h, 14 h to 15 h, 17 h to 18 h, 20 h to 21 h, 23 h to 24 h | Second pulses of 5 cycles of 1 000 Hz modulation. Second 59 is omitted. Announcement of hours and minutes every 5 minutes, followed by 3 m of 1 000 Hz or 440 Hz modulation. DUT1 : CCIR code by lengthening. |

| TDF | Allouis France 47° 10'N 2° 12'E | 162 | continuous except every Tuesday from 1 h to 5 h | Phase modulation of the carrier by + and - 1 radian in 0.1 s every second except the 59th second of each minute. This modulation is doubled to indicate binary 1. The numbers of the minute, hour, day of the month, day of the week, month and year are transmitted each minute from the 21st to the 58th second, in accordance with the French legal time scale. In addition a binary 1 at the 17th second indicates that the local time is 2 hours ahead of UTC(summer time); a binary 1 at the 18th second indicates that the local time is one hour ahead of UTC(winter time); a binary 1 at the 14th second indicates that the current day is a public holiday (Christmas, 14 July, etc...); a binary 1 at the 13th second indicates that the current day is a day before a public holiday. |

Second 30 is omitted. Between seconds 40 and 50 of each minute, voice announcement of the identification of the station. Between seconds 52 and 57 of each minute, voice announcement of hour, minute and second. |

NOTES ON THE CHARACTERISTICS OF THE SIGNALS

(1) OMA, 50 kHz

The main transmitter in Liblice radiates approximately 7 kW and the stand-by transmitter in Podebrady ($50^{\circ} 9'N$, $15^{\circ} 9'E$) approximately 50 W. The details of the time code were published in Nomenclature des stations de radiorepérage et des stations effectuant des services spéciaux.

Liste VI, Volume I, édition 7 de U.I.T. in Geneva in July 1980.

(2) USSR radiostation emitting DUT1 information in accordance with the CCIR code and also giving an additional information, dUT1, which specifies more precisely the difference UT1 - UTC down to multiples of 0,02 s, the total value of the correction being $DUT1 + dUT1$. Positive values of dUT1 are transmitted by the marking of p second markers within the range between the 21th and 24th second so that $dUT1 = +p.02$ s. Negative values of dUT1 are transmitted by the marking of q second markers within the range between the 31th and the 34th second, so that $dUT1 = -q.02$ s.
