1 Summary

1.1 General informations

This Calibration Report released by LNE-SYRTE is about the relative calibration campaign of GPS receivers located at PTB DLR RISE ROA INRiM.

It is built according to the Annex 4 of the document “BIPM guidelines for GNSS equipment calibration”, V3.2 15/02/2016, and contains all the required information, data, plots and results either required by BIPM in the frame of the CCTF Working Group on GNSS, or by BIPM and EURAMET in the frame of the Group1/Group2 calibration scheme. It also contains the uncertainty budget computation according to the Guidelines, which is showing whether the calibrated links used in the frame of the TAI computation would be in line with the conventional values.

1.2 Calibration report changes

This is Issue 1.1 of the calibration report. With respect to issue 1.0 the main changes are about the P3 uncertainty computations.

2 Acronym list and Reference Documents

2.1 Acronym list

ADEV:	Allan deviation, square root of AVAR
AVAR:	Allan variance or two-sample variance
BIPM:	Bureau International des Poids et Mesures, Sèvres, France
CCTF:	Consultative Committee on Time and Frequency
CGGTTs:	CCTF Global GNSS Time Transfer Standard format
CIPM:	Comité International des Poids et Mesures
DI:	Designated institute
DLR:	Deutsches Zentrum für Luft- und Raumfahrt
GFZ:	Geoforschungszentrum
GLONASS:	Russian GNSS
GNSS:	Global Navigation Satellite System
GPS:	United States of America GNSS
INRiM:	Istituto Nazionale Ricerca Metrologica, Italian NMI
LNE:	Laboratoire National de Métrologie et d'Essais, French NMI
LNE-SYRTE:	French NMI for Time and Frequency units
MDEV:	Modified Allan deviation, square root of MVAR
MVAR:	Modified Allan variance
NMI:	National Metrology Institute
NRCan:	National Ressources Canada
OP:	Observatoire de Paris, France
PPP:	Precise Point Positioning
PPS:	Pulse per second
PTB:	Physikalisch-Technische Bundesanstalt, German NMI
RINEX:	Receiver International Exchange format for Geodesy
RISE:	Research Institutes of Sweden, Swedish NMI
ROA:	Real Instituto y Observatorio de la Armada, Spanish DI for Time and Frequency units
SYRTE:	Systèmes de Référence Temps-Espace, OP laboratory where LNE-SYRTE is located
TDEV:	Time Allan deviation, square root of TVAR
TIC:	Time Interval Counter
TVAR:	Time Allan variance derived from AVAR and MVAR

3 Description of equipment and operations

The relative calibration of the GPS receiver located at PTB DLR RISE ROA INRiM was organized by LNE-SYRTE with the support of local Colleagues. The reference receiver for this measurement campaign is OP71, a Septentrio PolaRx4 multichannel multi-frequencies receiver located in OP. This receiver was relatively calibrated by BIPM in the frame of a G1 calibration campaign during winter 2018/2019 (#1001-2018).

The traveling equipment was made of two Septentrio PolaRx4 receivers called OPM7 and OPM3, together with a Choke-Ring Ashtech antenna and a 50 m antenna cable.

All the involved equipment are described inside the BIPM information sheets provided in Annex E for all receivers and all locations. Table 1 presents a summary of the timetable and of the equipment.

4 Data used

All OP collected raw data are transformed into GPS RINEX 2.11 format by using the UNAVCO TEQC software. Local receivers RINEX 2.1 data are provided by the visited laboratory. The calibration is

consisting in building differential pseudoranges for each code P1 and P2 between pairs of receivers, these differences being corrected by the known reference (REFDLY) and antenna cable (CABDLY) delays when available. For each location, the coordinates of the antenna phase centers are especially computed for the calibration period from RINEX files by using the NRCan PPP software. The geometric correction between pairs of antenna phase centers for receivers in common-clock set-up is computed by using BRDC files provided by IGS .

As conservative estimate, the noise of the P1 and P2 differences is obtained from the highest value of the one-sigma statistical uncertainty of the TDEV at 1 d. In the case there is not enough data to compute a TDEV at 1 d, the upper limit of the last error bar available is considered as noise of the raw differences. The noise of P3 data is issued from a similar TDEV analysis.

Reference delays are measured against the local UTC(k) physical reference point at the trigger level currently used in the involved laboratories. Antenna cable delay is either obtained from dedicated measurements or included in the P1 and P2 delays when no value is available for this parameter. In this latter case, the CABDLY value is set to 0 in the parameter file.

For validation purposes, P3 CGGTTS files are computed by using the R2CGGTTS software provided by P. Defraigne (ORB), and CV are built between pairs of receivers. This is more especially the case between the two traveling receivers in each location, in order to better assess the stability of this traveling ensemble all over the calibration campaign. We have decided to consider as overestimated value for the traveling equipment stability during the campaign the upper value between the highest misclosure between the start and the end of the campaign on one side and the highest mean offset between the two traveling receivers obtained from CV on the other side.

5 Results of raw data processing

Table 2 provides a summary of the P1 and P2 delays computed from the raw differences between RINEX files, together with the REFDLY and CABDLY used for these computations. The REFDLY and CABDLY values were either measured on site or taken as known parameter for a given receiving chain. Table 2 also includes the P1 and P2 internal delays of traveling equipment as computed against OP71, in average between the start and the end of the campaign, with the related REFDLY when located in remote stations. From our point of view, this table is the most comprehensive summary of the calibration campaign.

Table 2: Summary information on receivers delay (all values in ns).

In addition, the Table 3 is providing the raw difference (Rawdiff) values as required by reference [1]. Note that some DICOM receivers are already including all the implemented delays in the RINEX data. Therefore, we are first providing the raw computation results, and then compute additionally the actual INTDLY to be implemented according to Annex D. The actual delays for all the receivers are provided in table 26. All the plots of P1 and P2 computed delays and of the related TDEV analysis are provided in Annex B. The P3 CV computed by using the results of the calibration and the related TDEV analysis are also made available in Annex B.

6 Calibration results

6.1 Traveling system against reference system

Table 4 is providing the computed internal delays INTDLY P1 and P2 for both traveling receivers OPM7 and OPM3 against the reference receiver OP71 at the start and at the end of the campaign. The mean values are the ones used for the computation of the visited equipment delays.

Table 3: Summary information on raw calibration results (all values in ns).

6.2 Visited systems with respect the traveling system

Table 5 is providing the computed internal delays INTDLY P1 and P2 for the visited systems by using OPM7 and OPM3 as reference systems. In addition, it also provides the differences between both traveling receivers, allowing for a monitoring of the stability of traveling equipment during the whole campaign.

Table 5: Traveling vs. Visited system (all values in ns).

6.3 Uncertainty estimation

We provide in this section an estimation of the uncertainty of the differential calibration for the receivers located at visited laboratories. All the uncertainty budgets have been built according to the reference [1] in order to provide the required u_{CAL0} values. The details on the systematic uncertainties are provided in

Annex C. Note that we have chosen as u_b for misclosure the upper values between the actual misclosure between the start and the end of the campaign and the offset between both traveling equipment.

In the calibration process only P1 and P2 delay are estimated, therefore the misclosure for P3 delay is not directly available from the calibration computation. The P3 misclosure is estimated by applying the formula:

$$P3 = P1 + 1.546 \times (P1 - P2)$$

to the misclosure values computed for P1 and for P1-P2.

Table 6: PTBB uncertainty contributions (all values in ns).

Uncertainty	Value P1	Value P2	Value P1-P2	Value P3	Description

7 Final results for the system to calibrate

Table 26 is providing the final results of this calibration campaign, by following the BIPM Guidelines. Additional computation for Dicom receivers implementing delays in Rinex files is reported in annex D. In addition, Table 27 is providing the computed conservative $k = 2$ expanded uncertainties in order to be in line with EURAMET recommendations. The PTB DLR RISE ROA INRIM calibrated links used in the frame of the TAI computation are in line with the conventional combined uncertainty of 2.5 ns.

Table 26: Summary information on the calibration trip.

8 Acknowledgments

We acknowledge the help of the Colleagues in all visited sites for achieving the activities required for a successful calibration campaign according to the planning. Very special thanks to Andreas Bauch (PTB) for the last minute transfer to the next site, after the failure of the French institution in charge of the equipment transport.
