

# **Results of differential calibration of geodetic-type receivers at the PTB**

Last updated 31 January 2009

## **1. General description of the calibration**

This report concerns the calibration of the hardware delays incurred by time signals for different geodetic-type GPS systems operated at the PTB in Braunschweig.

The systems (receiver+antenna) are designated by a 4-letter acronym.

The link between acronym and actual hardware references may be found [here](#).

The results presented in Section 3 should be used for time transfer with other equipment calibrated using the same procedure. The standard uncertainty on such a link calibration is taken to be 5 ns (1  $\sigma$ ).

## **2. Calibration procedure**

The calibration is a differential calibration with respect to a travelling receiver provided by the BIPM. The travelling receiver is referenced to the BIPM reference receiver, presently BP0C, an Ashtech Z12-T (see [TM116](#) for the original calibration of the reference receiver).

The calibration operational procedure is available [here](#). Note that different versions of the document were used, depending on the epoch of calibration; see the annex “Revision history” in the most recent version.

## **3. Calibration results**

System	Period	Calib. dates	Travel	Results P1-P2/ns	Operations report
PTBB	2002/07	52471-52478	BP0C	<a href="#">304.1 – 318.5</a>	<a href="#">Report2002_PTB.pdf</a>
