GPS calibration of IMBH equipment with respect to PTB G1 (1011-2019)

Summary

Over January to June 2019, the Physikalisch-Technische Bundesanstalt, Germany (PTB) conducted a trip to calibrate GNSS equipment owned by the Institute of Metrology of Bosnia and Herzegovina (BIPM acronym IMBH). The trip started and finished at the PTB, providing closure with respect to PTB Group1 reference receiver PT09. The operations and report of measurements are described in in the report by PTB.

In September 2021, the IMBH conducted a transfer of calibration from the receiver BH02, part of the original trip, to a new receiver BH03, see the report by IMBH.

- Final results for the originally calibrated system

The INTDLY values of the IMBH receivers given in Table 1 have been computed by PTB based on the results of the 1001-2018 Group 1 trip for PT09 and should not be updated to reflect later changes in the conventional INTDLY values of the reference receivers.

For a P3/PPP UTC link A-B involving any Group 1 and any receiver in this trip, the uncertainty resulting from the calibration, $U_B(A-B)$, is computed as

$$U_B(A-B) = (U_{CAL0}^2 + U_{CAL}(A)^2 + U_{CAL}(B)^2)^{1/2}$$

(1)

where $U_{CAL0} = 2.5$ ns at the time of calibration, as given conventionally to Group 2, and where $U_{CAL}$ (generally zero) is specified for each system.

For single frequency C1 links, $U_{CAL0}$ is 2.5 ns but could be complemented by an additional component to represent systematic errors in the ionospheric model.

Changes in the set-up of the receivers after the calibration must be accounted for as described in section A.3.6 of the most recent Calibration guidelines in https://webtai.bipm.org/ftp/pub/tai/publication/gnss-calibration/guidelines/.

Table 1. Final P1/P2/C1 INTDLY values from the 1011-2019 trip. Values of REFDLY with respect to UTC(k) and of CABDLY during the calibration are also indicated for reference as available. All values are in ns. “Meas. Date” refers to the first day of the differential calibration, to which the calibration results can be applied. “Impl. Date” is the MJD when the results should be implemented in the receiver.

Notes:

(1) BH01 moved to 1101-2020 on MJD 59001.
Transfer of calibration performed by IMBH in September 2021

The receiver BH03 has been differentially calibrated with respect to BH02 in September 2021, see the report by IMBH.

The value $\Delta U_{\text{CAL}}$ is to be added to compute the final calibration uncertainty for links including the receiver BH03. It has been adopted from uncertainties given in the reports by IMBH.

Table 2. Final P1/P2/C1 INTDLY values for the BH03 receiver. Values of REFDLY and CABDLY during the calibration are also indicated for reference. “Meas. Date” refers to the first day of the differential calibration, to which the calibration results can be applied. “Impl. Date” is the MJD when the results are implemented in the CGGTTS files.
