GNSS calibration of VMI receivers with respect to TL G1 (1011-2022)

Summary

From March to June 2022, the Telecommunication Laboratories (TL) conducted a trip to calibrate GNSS equipment owned by the Vietnam Metrology Institute (VMI). The trip started and finished at the TL, providing closure with respect to the TL Group1 reference receiver TLT5. The operations and report of measurements are described in the report by TL.

- Final results for the calibrated systems

The INTDLY values of the receivers given in Table 1 have been computed by TL based on the results of the Group 1 trip 1001-2020 for TLT5 (GPS and Galileo) and should not be updated to reflect later changes in the conventional INTDLY values of the reference receiver.

For a P3/E3/PPP UTC link A-B involving any Group 1 and any receiver in this trip, the uncertainty resulting from the calibration, $U_{B}(A-B)$, is computed as

$$U_{B}(A-B) = (U_{CAL0}^2 + \Delta U_{CAL}(A)^2 + \Delta U_{CAL}(B)^2)^{1/2}$$

(1)

where $U_{CAL0} = 2.5$ ns is the conventional Group 2 value, and where $\Delta U_{CAL}$ (generally zero) is specified for each system.

Changes in the set-up of the receivers after the calibration must be accounted for as described in section A.3.6 of the most recent Calibration guidelines in ftp://ftp2.bipm.org/pub/tai/publication/gnss-calibration/guidelines/.

Table 1. Final P1/P2/E1/E5a INTDLY values from the 1011-2022 exercise. Values of REFDLY and CABDLY during the calibration are also indicated for reference. All values are in ns date in YYYY/MM/DD format. “Meas. Date” refers to the first day of the differential calibration, to which the calibration results can be applied. “Impl. Date” is the MJD when the results should be implemented in the receiver.
