5th BIPM TWSTT Monthly Report

To: TWSTT Participating Stations

Dear Colleagues,

Please find enclosed the fifth monthly report on the handling of TWSTT data at the BIPM.

For the second month the TWSTT link between the TUG and the PTB has been used for the computation of TAI. The collection of data and the data-processing procedures are running smoothly, and we can consider them fully operational. The GPS link between the TUG and the PTB is also computed as a check and the data kept in reserve. The TUG/PTB TWSTT and GPS links are compared in Table 1 of the Appendix to this report.

As usual we present some selected TWSTT links which are computed and compared to GPS at the time of preparation of *Circular T* but are not yet used for the construction of TAI. The results of the computation of seven such links are given in Tables 2 to 8 of the Appendix. We have added a new link NPL/PTB.

The OCA station resumed operation during the summer, and its data will be included in our monthly report as soon as they are available on routine basis. The IEN and ROA stations are approaching operational status.

We stress the need for the calibration of TWSTT links by transportation of a TWSTT station, by transportation of a GPS or GLONASS receiver, or at least by means of values published in *Circular T*. Calibrations should be undertaken between pairs of stations.

Some remaining minor operational problems are treated on a day-to-day basis in collaboration with the laboratories concerned, and more TWSTT links will be introduced into TAI as soon as their reliability is proved.

We will be pleased to receive your comments on this report.
With our best regards,

Jacques Azoubib and Włodzimierz Lewandowski

Appendix

to 5th BIPM TWSTT Monthly Report

TWSTT links computed at the BIPM

Because the TWSTT data are unevenly spaced by intervals of 2 or 3 days, they are linearly interpolated to give the data for the TAI standard dates at intervals of 5 days.

Note*: When TWSTT sessions are missing and data are interpolated between TWSTT sessions more than 5 days apart, results are printed in bold characters.

Note 1: The TUG/PTB TWSTT link was calibrated by the transportation of a TWSTT station in May-June 1998. Until 30 June 1999 the *Circular T* GPS data for TUG were calibrated using an outdated value; this is the reason for the offset of about –22 ns between the two techniques.

Note 2: The TUG/PTB TWSTT link has been included in the computation of TAI since July 1999. This link was calibrated by the transportation of a TWSTT station in May-June 1998.

The GPS link between the TUG and the PTB is also computed as a check and the data kept in reserve; this link was calibrated by the transportation of a GPS receiver in May-June 1998 (4th BIPM GPS calibration trip).

It is of note that, for the TUG/PTB link, the TWSTT and GPS techniques were independently calibrated, and the results agree to within the associated uncertainties.

Notes: The PTB/NIST TWSTT link was calibrated by *Circular T* prior to July 1999.

Since July 1999 the GPS link between Europe and North America has been corrected by ionospheric delays derived from an IGS map, rather than as previously by direct ionospheric measurements. This is the reason for the step of about 8 ns at the beginning of July 1999 between the TWSTT and GPS values.

† Hardware and automation problems have rendered USNO TWSTT data between 5 June 1999 and 25 July 1999 unreliable.

Notes: The USNO/PTB TWSTT link was calibrated using *Circular T* of May 1997. At this time the USNO GPS time-receiving equipment was inaccurate by about 23 ns, which explains the offset between the TWSTT data and the *Circular T* data observed.

Notes: The VSL/PTB TWSTT link was calibrated by *Circular T*.

The transmitted power of the TWSTT signal from VSL has been suffering from an extra attenuation of up to 6 dB since 30 June 1999. The VSL TWSTT data were not available between 9 July 1999 and 2 August 1999.
